A 57-year-old female with no past medical history and no symptoms, who was referred to the Internal Medicine Consultation for the presence of albuminuria with a creatinine clearance of 87.3 mL/min. It was detected grade II arterial hypertension and started indapamide and perindopril. The complementary study carried out evidenced a horseshoe kidney on renal ultrasound and a double contour image in the aortic root (anterior Valsalva sinus) on transthoracic echocardiography (Fig. 1), besides left atrial enlargement. To clarify this lesion, a cardiac computed tomography angiography was done (Fig. 2). This showed a common origin of the coronary arteries in a single ostium in the right coronary sinus, in which the common trunk of the left coronary artery has a long trajectory between the right ventricular outflow tract and the aorta. There was no evidence of extrinsic static compression images and no evidence of atherosclerotic disease. She underwent a cardiac stress test that not showed signs of myocardial ischemia or dysrhythmias. A conservative approach was adopted with vigilance and control of arterial hypertension and cardiac frequency with perindopril, indapamide and bisoprolol. Current follow-up of 5 years without intercurrences.

Coronary anomalies are rare and mostly asymptomatic as they are often diagnosed incidentally. Its clinical significance depends on the origin, course and amount of perfused myocardium. The symptoms result from myocardial ischemia or dysrhythmias. The single coronary artery is a very rare congenital anomaly with an incidence between 0.0024-0.044%2. The obstruction of this single vessel is devastating due to the absence of collaterals. In addition, the inter-arterial pathway may, in the presence of a hypertensive peak, compromise myocardial perfusion and thus culminate in sudden death1. The surgical revascularization can be considered in these cases mainly if there is evidence of ischemia2.

The interesting point of our patient is that she has two potentially malignant anomalies (single coronary artery and inter-arterial course of the left coronary artery) and have none cardiovascular event so far.
